## Prescription for Change

**Article:** *Prescription for Change*. The Wall Street Journal. October 20, 2008. Author: Amar Gupta.

**Link:** <http://online.wsj.com/article/SB122426733527345133.html>

**Concept:** Global Revolution

### Brief Synopsis of Article:

Global revolution is happening in the health care industry to keep up with information technology. Information technology is going to revolutionize the health care system in four ways: drug-safety monitoring (on a global scale), more offshore services, health information systems integration, and higher quality information more readily available to patients and doctors.

### My thoughts:

I think this new way of handling health care systems is going to hopefully make medical processes easier and provide a wider range of expertise from multiple physicians, doctors, etc. I think that it is very important that many different people look over cases and symptoms to determine the true cause of a sickness, illness, disease, etc. It is important that a patients medical records can be accessible from anywhere in the world on a secure database, and I believe this is going to start helping that happen. Maybe this will help medical professionals from around the world to use all their possible resources to make new discoveries and combat more medical conditions.
